Professional Development Framework Documentation (PDF)

Reviewee: **Paul Ozioko** **Reviewer:** **Monali Patel** **Date:** **16 September 2025**

Position: Computer science and Mathematics teacher

Self Reflection

Once this section is completed, please share it with your reviewer. You will use this in your discussion at your first Review Meeting.

I aim to be the best I can be in assessing my students' understanding (Cluster 1 of walkthrus) through my precise use of cold calling, think-pair-share, show-me boards, and checking for understanding.

Reflect with precision on the strategies you have explored, noting their impact on student learning. Describe areas you feel you are confident in, as well as the areas you want to develop further in.

Cold calling has worked really well in my Python and Java lessons. It keeps everyone on their toes and makes sure all students feel part of the discussion, not just the ones who usually put their hands up. I've observed how it encourages more thoughtful answers and creates a classroom where everyone has a voice.

I also find Think-Pair-Share to be powerful in computer science, especially because it feels so close to peer programming, which is a key collaboration and problem-solving technique in real world software development. When students bounce ideas off each other before sharing back, they often catch mistakes, clear up confusion, and explain a block of code in ways they can easily relate with . It has been especially useful in lessons on control structures in Python, when troubleshooting or modifying codes both in python and Java languages and in learning Decomposition, a key computational construct where I allowed each group of students to solve different components of a bigger problem and present their solutions as integral components of the big problem.

Moreover, Think Pair Share enables my computer science students to talk through a given problem fostering engagement and developing the required

vocabulary needed for better understanding.

These strategies have given me a lot of confidence in helping students not just follow along, but really think and engage with the material.

What I want to get better at now is finding ways to measure how much these approaches actually improve their learning—not just their participation.

Professional Development Process

Targets (To include teaching, tutor/guidance and leadership targets)

Link to the Professional Standards here

1) Start of the year

Targets	**Action Plan for Success** **(What strategies will I use to achieve my targets, and what evidence will I provide?)**	**By When?**	**Resources/ Support Nee**

Professional Development Framework Documentation (PDF)

Target 1: Focused on High Quality Learning - the walkthru process **I aim to actively foster students' engagement and teamwork to improve learning outcomes.**	I will enhance my Computer Science teaching by incorporating Think-Pair-Sh and peer programming—two essential collaborative strategies—to equip students with teamwork, problem-solving, and practical computing skills di applicable to real-world computing projects. Evidence I will provide: ● Linked lesson plans / slides ● Completed student works	End of term 1	● Purposefully Desi Lessons ● Coding challenges ● Group programmi projects ● Students works
Target 2: Personal : I aim to train student design, develop, and maintain functional websites, fostering digital innovation and competitiveness.	I will run a two-term website development ECA where students with or with any prior knowledge learn to design, build, and maintain functional website using industry-relevant tools. Evidence I will provide: ● Students' works.	End of term 2	● Website design projects.

3) End of Year Review

Targets focussed on improving student learning (What I am aiming to achieve)	**(Links to evidence are essential; please make sure your Reviewer has access to all the evidence)**
Target 1: Focused on High Quality Learning - the walkthru process	Cold calling and Think-Pair-Share/ peer programming were effective in improving participation, collaboration, and problem-solving during Python and Java lessons, particularly encouraging quieter students to contribute more confidently. Moving forward, I will provide more thinking time, scaffold questions more carefully, and include greater individual accountability to strengthen students' confid and independent understanding.
Target 2: Personal	The website development and Python Programming ECAs enabled students to apply their knowledge planning and building functional websites and simple real-world software applications, such as online booking systems, which strengthened their creativity, technical skills, and problem-solving ability. However, some students needed additional support when working independently or applying real-wo requirements to their projects. As a next step , I plan to increase the use of structured peer feedback introduce more challenging development tasks to further strengthen students' practical programming ability, teamwork, and independent problem-solving skills, while preparing them to compete favourab a technology-driven future.

Reviewee Summary Comments:

Over the course of the year, I contributed to students' technical, creative, and problem-solving development through a range of Computer Science initiatives, curriculum improvements, and enrichment activities. Key achievements include:

- Led the website development and Python Programming ECAs, where students created functional websites and simple real-world software applications, including online booking systems.

- Developed students' creativity, collaboration, computational thinking, and practical programming skills, helping prepare them for a technology-driven future.

- Participated in a year 7 Computer Science-related trip that exposed students to real-world applications of computing concepts and interactions with industry professionals. Following the trip, students independently designed and developed space-themed games and interactive projects using Scratch, inspired by the experiences and knowledge gained during the visit. These projects were linked to the Computer Science curriculum and demonstrated students' ability to apply programming concepts, computational thinking, problem-solving, and creativity while extending their learning in a meaningful and engaging context.

- Accompanied a group of students to the CyberAsia Conference, a leading regional event that brought together cybersecurity experts from across Asia to discuss emerging cyber threats, industry challenges, innovations, and the latest cybersecurity solutions. The visit provided students with valuable exposure to real-world applications of computing and cybersecurity, allowing them to engage with current developments and industry professionals. Furthermore, the conference established a strong foundation for IB Computer Science students undertaking Extended Essays

Professional Development Framework Documentation (PDF)

related to cybersecurity by deepening their understanding of contemporary issues, research opportunities, and industry perspectives.

- Updated the GIS Computer Science curriculum to align with the revised IBDP Computer Science syllabus.
- Supported the successful coordination of House Sports Day by managing and updating scores from multiple events in real time as the event scorer.

Building on these achievements, I plan to introduce more challenging real-world programming projects, structured peer feedback, and AI-focused activities within future ECAs. Following professional development training in Machine Learning, I am now better prepared to introduce students to foundational AI concepts, including training and testing simple AI models.

Reviewer Summary Comments: Please refer to additional information - contribution to the wider aspects of school life, extracurricular activities, pastora care of Class or Tutor group, and personal and professional conduct.

Paul has set clear, highly relevant professional development targets focused on collaborative learning and real-world application. His plan to integrate Think-Pair-Share and peer programming into the Computer Science curriculum demonstrates a strong focus on building critical teamwork and problem-solving skills. This classroom goal is perfectly complemented by his commitment to running a two-term website development ECA, providing an inclusive platform for students of all abilities to master industry-relevant tools.

Beyond these targets, Paul's wider contributions to the school have been exceptional. He has successfully enriched the ECA program, guiding students

Professional Development Framework Documentation (PDF)

to build functional software like online booking systems, while his curriculum development work ensured the GIS Computer Science syllabus is fully aligned with the revised IBDP standards. Furthermore, Paul brought his technical expertise to the wider school community by managing real-time scoring for House Sports Day and supporting an industry-focused Computer Science trip, which inspired students to design their own space-themed games. Demonstrating an admirable commitment to professional growth, he also completed Machine Learning training, positioning himself to introduce cutting-edge AI concepts into future projects. Paul is highly commended for his forward-thinking approach and outstanding dedication.
